Presentation

play

Under Supervision

Prof. Dr / Amal Gharib

Head of pediatric Nursing Department

Prof. Dr / Madiha Hassan

Prof.Dr / Hanan Nabawy

General supervisor of practical training of pediatric nursing department

Dr / Amany Aśr

Instructor of pediatric nursing department

Faculty of nursing Benha University

3rd Year – 2st semester

Group 5&6

2025/2026

رؤية كلية التمريض:

الوصول إلى مكانة رائدة بين كليات التمريض محليًا وإقليميًا ودوليًا.

رسالة كلية التمريض:

تلتزم كلية التمريض – جامعة بنها بإعداد خريجين قادرين على تقديم رعاية تمريضية شاملة بدرجة عالية من الكفاءة والتميز في مجالات التعليم والبحث العلمي وخدمة المجتمع والتنمية المستدامة، بما يسهم في تطوير مهنة التمريض محليًا وإقليميًا ويلبي احتياجات سوق العمل التنافسي

رؤية قسم تمريض الأطفال:

أن يكون قسم تمريض الأطفال متميزا في تقديم أفضل مستوى من الرعاية التمريضيه للأطفال بين كليات التمريض المختلفة التمريض

رسالة القسم:

يعمل قسم تمريض الأطفال بـ كلية التمريض – جامعة بنها على إعداد أخصائي
تمريض على درجة عالية من الجودة، قادر على تقديم الرعاية الصحية الشاملة
للأطفال في مختلف مراحل العمر، بالإضافة إلى العناية بذوي الحالات الخاصة في مختلف المؤسسات العلاجية، والمشاركة المجتمعية طبقًا للمعايير العالمية، مع القدرة على استخدام أساليب البحث العلمي

Learning objectives:

1. Define play correctly.
2. Discuss the different theories of play.
3. Explain the importance of play in child development.
4. Identify the different types of play.
5. Describe the stages of play according to the child's age.
6. Recognize the risk factors affecting play.
7. Discuss the complications related to play and their prevention.
8. Outline the safety measures during play.
9. Explain the role of the pediatric nurse in promoting therapeutic play.

Outlines

1. Introduction of play
2. Definition of play
3. Theories of play
4. Importance of play
5. Types of play
6. Stages of play according to age
7. Risk factors affecting play
8. Complication of play and their prevention
9. Safety measures during play
10. Role of pediatric nurse in promoting play
11. Conclusion

Introduction

Play is a natural, spontaneous activity that is essential to children's growth and development. It is often described as the "work of childhood" because through play, children explore the world, express emotions, build relationships, and develop physical and cognitive skills. Rather than being mere entertainment, play is a powerful learning process that supports holistic development.
From infancy, children engage in playful behaviors such as grasping objects, babbling, and imitating adults. As they grow, their play becomes more complex and purposeful. Through play, children practice problem-solving, creativity, language, and social interaction. It allows them to experiment safely with different roles and situations, helping them understand both themselves and others.

Definition

Play is a natural and voluntary activity that children engage in for enjoyment, which promotes the development of physical, cognitive, social, and emotional abilities through exploration, imagination, and interaction with the environment.

Theories of play

Play is a fundamental part of child development. Through play, children explore their environment, express emotions, develop cognitive abilities, and learn social rules.

1) Cognitive Theory (Jean Piaget)

- Play reflects cognitive development through:

✓ Assimilation: Fitting new experiences into existing schemes.

✓ Accommodation: Changing schemes to match new experiences.

2) Psychoanalytic Theory (Anna Freud)

- Play helps children master anxiety through repetition.
- It is both defensive and adaptive.

3) Cathartic Theory (Sigmund Freud)

- Play allows partial satisfaction of drives and resolution of conflicts.
- Through play, emotional tension is temporarily relieved.

4) Pre-Exercise Theory (Karl Groos)

- Play is practice for future survival skills.
- Children rehearse behaviors needed in adult life through play.

5) Growth Theory (Appleton)

- Play is driven by a general urge for growth.
- It supports the development of skills needed for adult roles.

Importance of play

1) Cognitive Importance:

- Promotes critical thinking and problem-solving skills through exploratory and constructive activities.
- Enhances imagination and symbolic thinking, especially in pretend or dramatic play.
- Strengthens memory, attention span, and executive functioning.
- Supports language acquisition and communication skills through interactive and social play.

2) Physical Importance:

- Play supports both gross and fine motor development.
- Improves muscle strength and coordination.

3) Emotional Importance:-

- Play is a natural medium for emotional expression and regulation.
- Provides a safe outlet for stress, fear, and frustration.
- Enhances self-confidence and autonomy.
- Promotes resilience and coping skills.

4) Social Importance:

- Play is crucial for the development of interpersonal and social competence.
- Teaches cooperation, sharing, and turn-taking.
- Develops empathy and perspective-taking.
- Improves conflict resolution skills.
- Strengthens peer relationships and teamwork abilities.

5) Therapeutic Importance:-

- Reduces anxiety associated with hospitalization or medical procedures.
- Facilitates communication in children who struggle with verbal expression.
- Used in play therapy to address trauma, behavioral disorders, and emotional disturbances.

Types of play

1) Functional Play

- This is simple and repetitive play.
- For example: throwing a ball, pushing a toy car, or banging toys.
- It is common in infants and toddlers and helps develop motor skills.

2) Constructive Play

- This type of play involves building or creating something.
- For example: building with blocks, drawing, or solving puzzles.
- It helps develop thinking and problem-solving skills.

3) Dramatic (Pretend) Play

- In this type, children use imagination and role-play.
- For example: playing doctor, teacher, or parent.
- It helps develop creativity, language, and social skills.

4) Physical Play

- This includes active body movement.
- For example: running, jumping, climbing, and playing outside.
- It improves physical health and gross motor skills.

5) Games with Rules

- These are organized games with clear rules.
- For example: football, board games, or card games.
- This type is common in school-age children and teaches cooperation and discipline.

Stages of play according to age

1. Unoccupied Play

- ✓ Age: Birth – 3 months
- ✓ The infant makes random movements with no specific purpose.
- ✓ This stage is the earliest form of play behavior.

2. Solitary Play

- ✓ Age: 6 months – 2 years
- ✓ The child plays alone and is not interested in playing with other children, even if they are nearby.

3. Onlooker Play

- ✓ Age: Around 2 years
- ✓ The child watches other children playing but does not participate.
- ✓ May ask questions or talk to them.

4. Parallel Play

- ✓ Age: 2 – 3 years
- ✓ The child plays beside other children using similar toys, but there is no direct interaction.

5. Associative Play

- ✓ Age: 3 – 4 years
- ✓ Children interact with each other while playing, but there is no organized structure or assigned roles.

6. Cooperative Play

- ✓ Age: 4 – 6 years
- ✓ Children play together with a common goal.

Risk factors affecting play

Although play is very important, it may carry some risks if not properly supervised:

1. **Physical Injuries**

- Falls and fractures
- Cuts and bruises
- Head injuries

2. **Choking Hazards**

- Toys with small parts
- Balloons
- Small balls

3. **Poisoning**

- Toys made of unsafe materials
- Swallowing small batteries

4. **Infection**

- Sharing unclean toys
- Playing in dirty environments

5. **Psychological Risks**

- Bullying during group play
- Violent games that may increase aggressive behavior

6. **Technology-Related Risks**

- Excessive video game use
- Reduced physical activity
- Social isolation

Complication of play and their prevention

1. Physical injuries (falls, cuts, fractures)
   - ❖ Prevention: Provide a safe play environment, use age-appropriate toys, and ensure close supervision during play.

2. Choking hazards from small toys
   - ❖ Prevention: Avoid small detachable toys and select toys suitable for the child's age group.

3. Infection transmission from shared toys
   - ❖ Prevention: Regular cleaning and disinfection of toys and maintaining proper hand hygiene.

4. Fatigue and overexertion
   - ❖ Prevention: Allow adequate rest periods and adjust play activities according to the child's health condition.

5. Emotional distress (fear and anxiety)
   - ❖ Prevention: Use therapeutic and developmentally appropriate play to provide comfort and reduce stress.

Safety measures during play

- Continuous supervision of children during play, especially toddlers and preschoolers.
- Use age-appropriate toys and equipment.
- Ensure the play area is safe: clean, dry, well-lit, and free from sharp or dangerous objects.
- Playground equipment should be stable, well-maintained, and placed on soft surfaces (sand, grass, rubber).
- Children should wear protective gear (helmet, knee/elbow pads) during cycling or skating.
- Avoid rough or aggressive play that may cause injury.
- Keep small objects away from young children to prevent choking.
- Teach children simple safety rules (no pushing, no running near swings, take turns).
- Ensure adequate hydration and rest periods during active play.
- Protect children from extreme weather (sun hats, sunscreen, avoid play in very hot or cold conditions).
- Keep first-aid supplies nearby during play activities.

Role of pediatric nurse in promoting play

1. Classifications of Play in Nursing Care

- **Therapeutic Play**
  - Helps children express hidden fears and emotional stress
  - Supports coping with hospitalization and illness
- **Medical Play**
  - Hands-on interaction with safe medical equipment
  - Reduces fear of procedures
  - Increases familiarity with hospital environment
- **Developmental Play**
  - Maintains physical, cognitive, and social milestones
  - Prevents developmental delay during illness

2. The Nurse's Strategic Roles

- **The Facilitator**
  - Creates a "safe haven" area
  - Ensures no painful procedures occur in play area
- **The Educator**
  - Uses dolls, puppets, and models
  - Explains procedures (IV insertion, surgery, chronic illness care)
  - Reduces anxiety through preparation
- **The Observer (Assessment Role)**
  - Physical Assessment:

- ✓ Lung capacity (blowing bubbles)
- ✓ Fine & gross motor skills (blocks, drawing)

- Psychological Assessment:
  - ✓ Detects regression
  - ✓ Identifies anxiety or depression
  - ✓ Observes coping behavior

3. Nursing Actions

- ➢ Assess emotional, cognitive, and physical status
- ➢ Plan appropriate type of play
- ➢ Facilitate activities safely
- ➢ Educate child and family
- ➢ Monitor responses (stress, fatigue, discomfort)
- ➢ Document interventions and outcomes
- ➢ Advocate for safe and meaningful play environment

Conclusion

Play is an essential and integral part of a child's growth and development. It supports physical, cognitive, emotional, and social well-being. In pediatric nursing, play is not considered a luxury but a fundamental need and a therapeutic tool, especially for hospitalized children. Therefore, nurses have a vital role in promoting safe, age-appropriate, and therapeutic play to enhance the child's overall health and reduce anxiety and stress.
